

cladding systems

LINEA – The new natural stone façade

**Sustainable and economical
Innovative technical design
Elegance and superior architectural quality**

The new natural stone façade

The patent-pending ventilated cladding system LINEA is arranged using smaller stone patterns and offers a wide variety of design options for the realization of high-end natural stone façades.

Our cladding systems consist of specific components that can be precisely combined and thus offer unrivaled flexibility in façade design. The simple installation and comprehensive manual bring our systems to the pinnacle in the world of façade design.

The inconspicuous aluminum sub-construction allows for fast and efficient installation of natural stone panels in a variety of dimensions, colours, and finishes. The revolutionary LINEA system enables the mounting of natural stone panels for small pattern claddings in an economical and mechanically safe way that was previously not feasible. The LINEA sub-construction consists of specialized vertical profiles and clips. These vertical profiles can be fixed to any type of primary sub-construction made of aluminum, steel or wood. Clip positions are pre-drilled on the vertical profiles using CNC machines to match the different panel dimensions and ensure an accurately fitted joint pattern. The clips can also be pre-installed on the profiles upon request.

The natural stone panels are grooved on the backside allowing anchoring in the clip. The stones can be calibrated to identical or intentionally different thicknesses to achieve customized esthetic properties such as shadow effects to better realize the clients' visions.

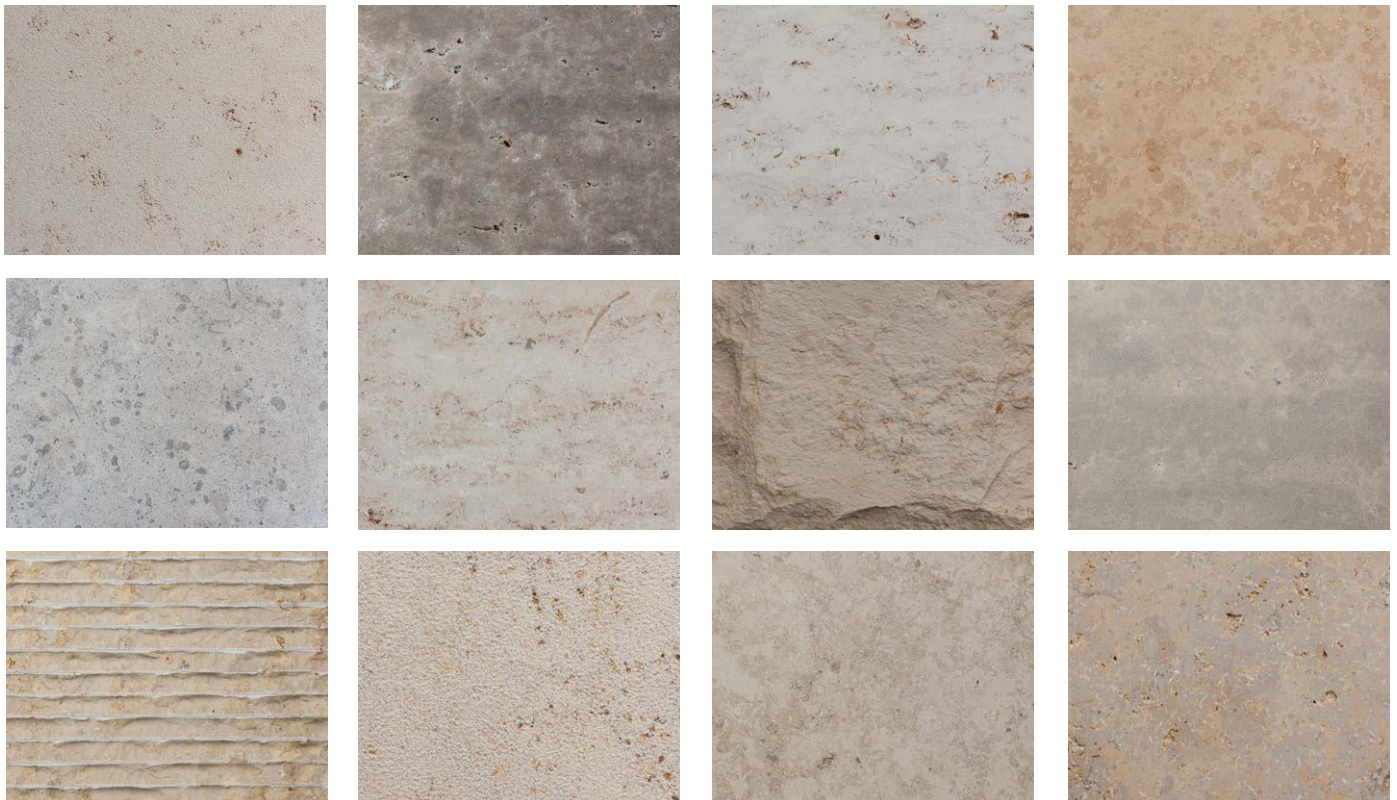

Product advantages

- Versatile design options through a wide range of natural-stones and finishes
- Small joints and inconspicuous anchoring
- Variable panel heights for an individualized cladding design
- Economical, small pattern natural stone cladding
- Stress-free anchoring of the individual stone panels
- Panels can be individually mounted and dismantled
- Economical design and installation utilizing random-length pieces
- Simple installation of pre-configured profile components regardless of weather conditions
- Exceptional sustainability with regards to natural resources, energy efficiency, durability and recyclability
- Realization of passive house standard in connection with a thermal-bridge free sub-construction from GFT Fassaden AG or BWM Dübel+Montagetechnik GmbH

Range of materials

Top of the line Dietfurt natural stones are ideally suited for different surface finishes. Their natural and timeless colours offer an enormous variety of design options and can be tailored to each client's vision.

For more information about our material range please visit www.linea-cladding.com.

Technical data

Natural stones

Dietfurt Limestone, Dietfurt Dolomite,
Dietfurt Travertine
Origin: Treuchtlingen-Dietfurt (Bavaria), Germany

Panel thickness

30 to 40 mm (alternatives available upon request)

Panel dimensions

- Panel heights: 120 to 200 mm
(alternatives available upon request)
- Panel lengths: random lengths up to 900 mm
(alternatives available upon request)

Fixing

Inconspicuous clip system

Finishes

- | | | |
|-----------------|-------------|------------|
| – sandblasted | – honed | – brushed |
| – bush-hammered | – Splitline | – Rockface |

UV-Protection

All panels are 100 % lightfast and UV stable

BKZ

6.3, non-flammable

Recycling

Natural stone and sub-construction are completely recyclable

Ecology

Suited for Minergie Eco

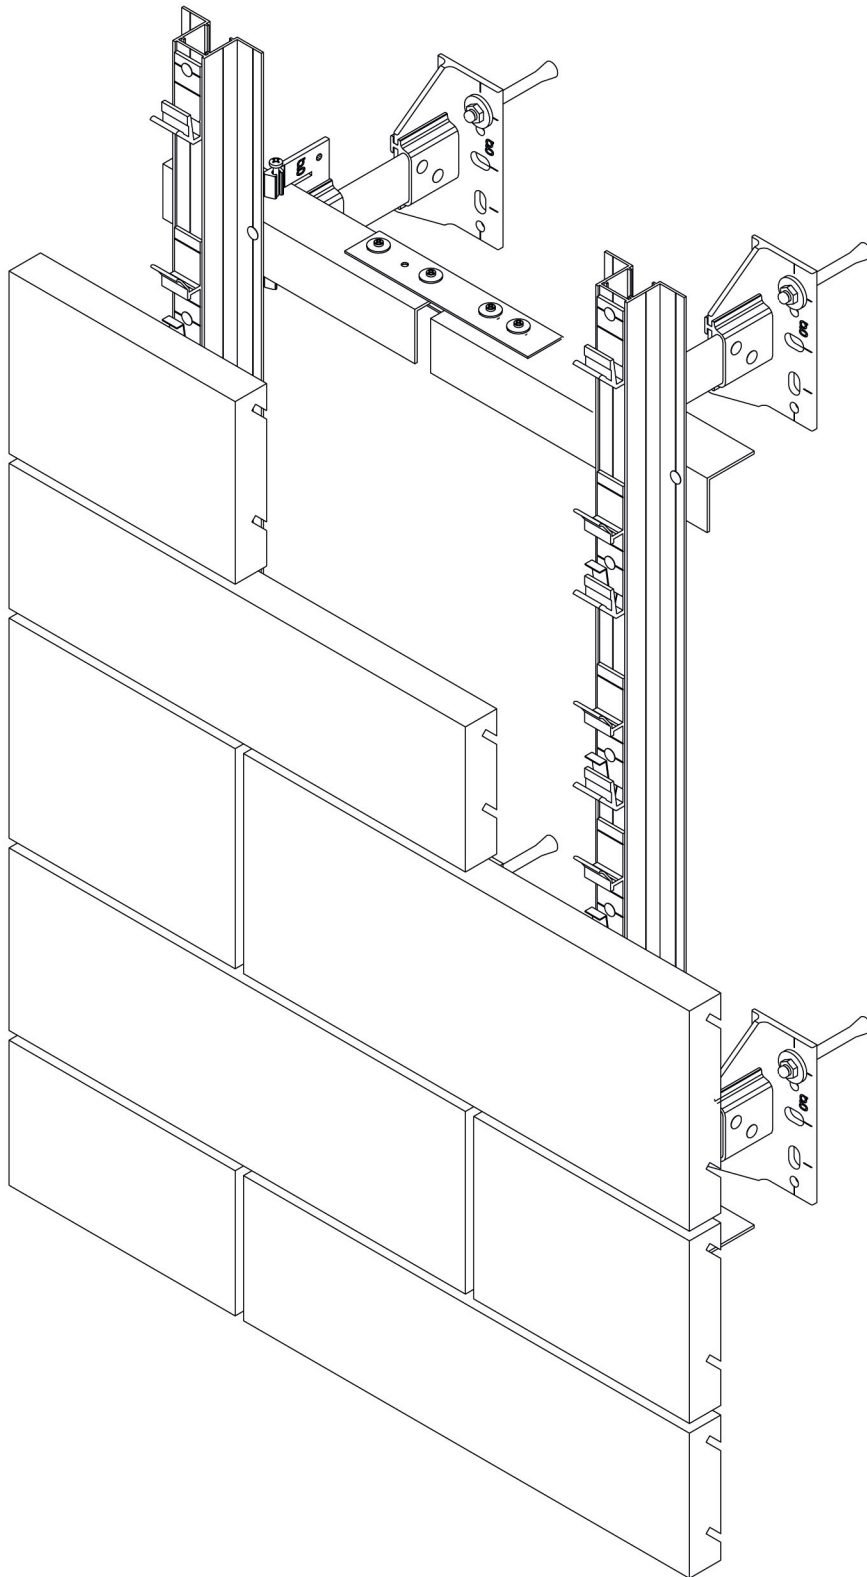

Additional features

Top quality workmanship and project specific fabrication
finished in our own factories allow for simple and
installation-friendly fixing

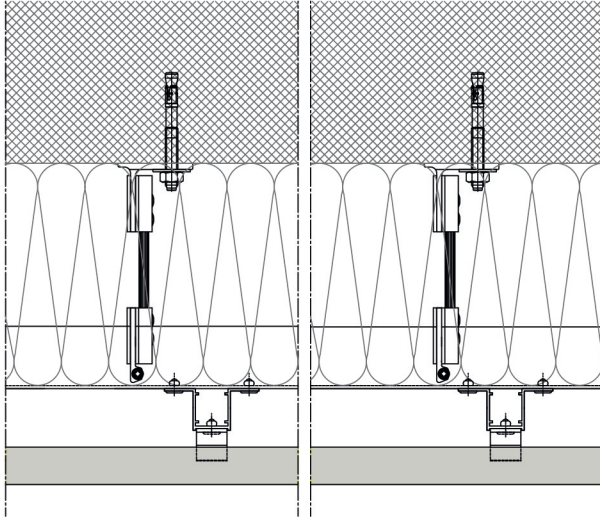

Technically innovative construction

Façade construction in a 3D-view

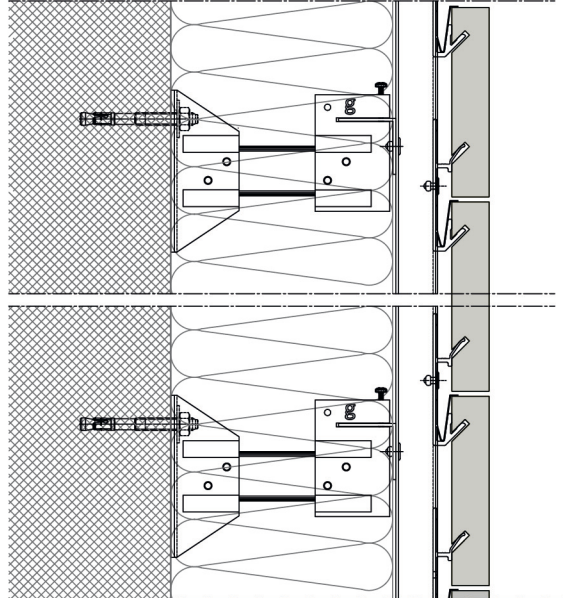

Façade construction with sectional drawings

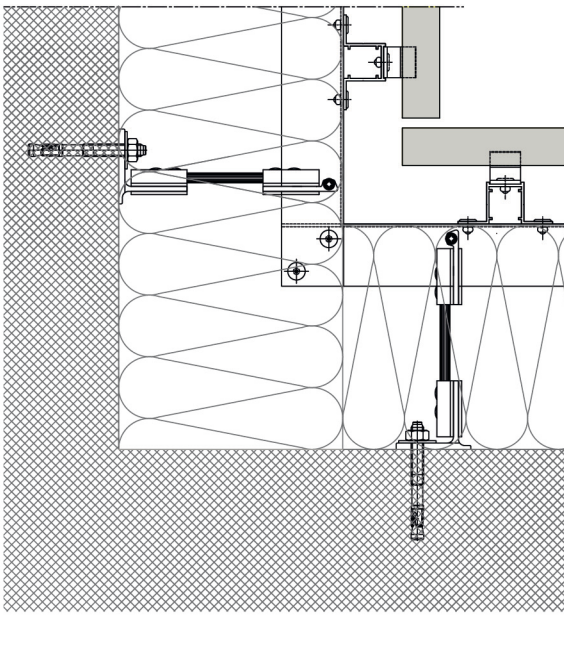

Horizontal view

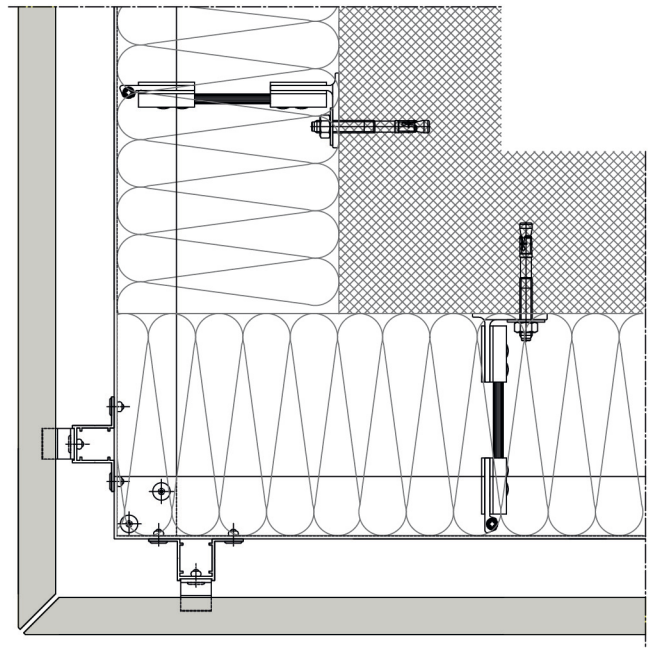

Vertical view

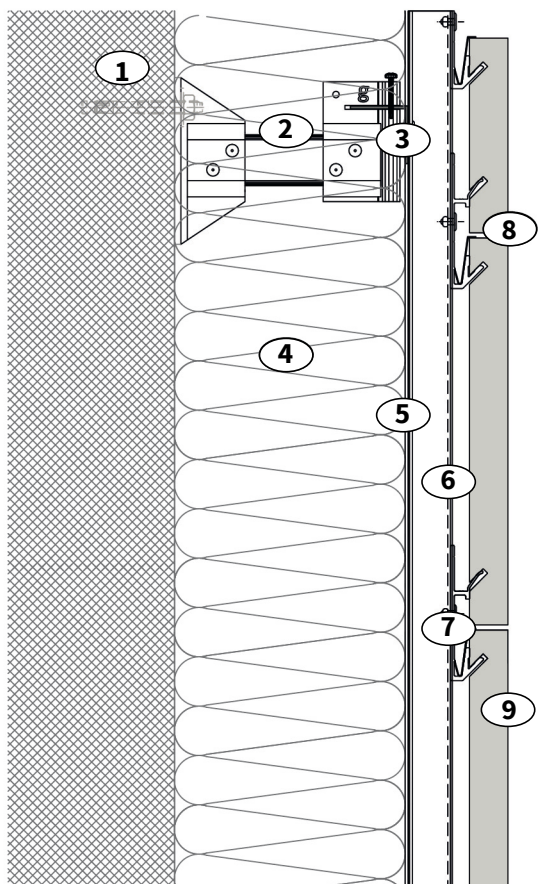

Interior corner

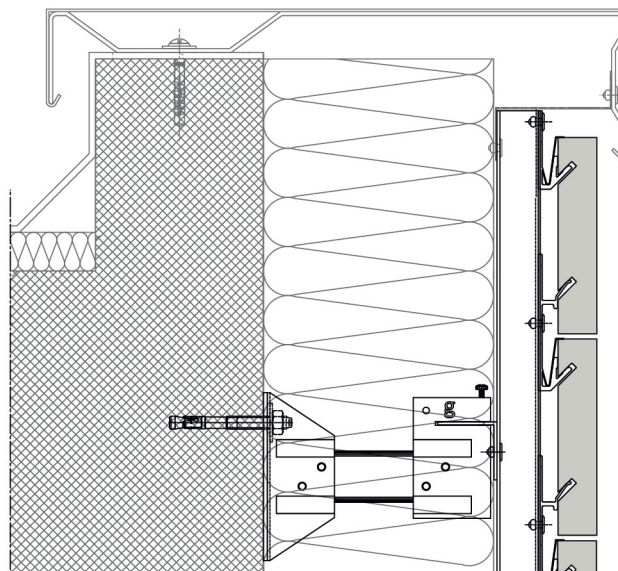

Exterior corner

Pedestal completion (bottom)

Attic completion (top)

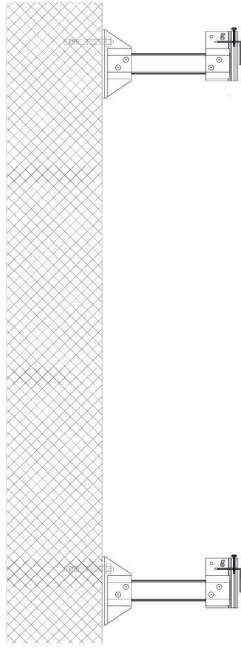

1. 1. Mounting bracket anchor
2. 2. GFT Thermico mounting bracket horizontal
3. 3. GFT 90° angle horizontal
4. 4. Insulation
5. 5. Cladding membrane
6. 6. Vertical GFT 88 load bearing profile
7. 7. GFT 88 joint bracket
8. 8. GFT 88 locking spring
9. 9. Natural stone with LINEA groove

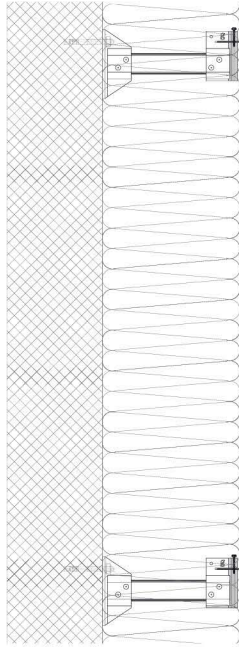

Installation is simple and not influenced by weather conditions

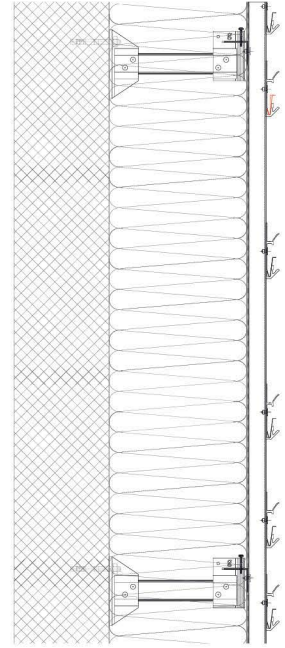

Installation sequence on walls

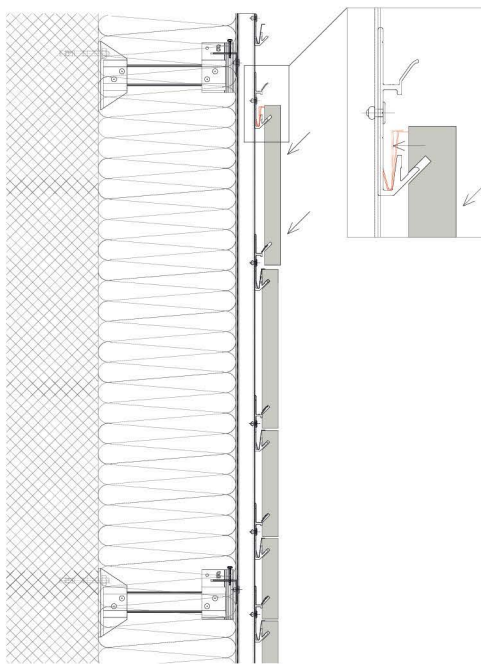

1. Installation of the primary underconstruction incl. arrangement of the horizontal L-angle.

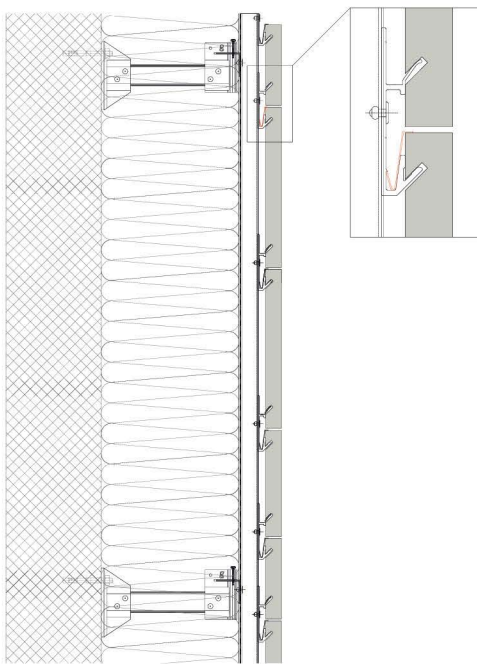

2. Installation of the insulation incl. anchorage. Cladding membrane are glued on the horizontal L-angle.

3. Vertical GFT 88 load bearing profile incl. pre-assembled clips are double riveted on the intersection of the horizontal L-angle. A fix- and variable floating point must be designed for the vertical profiles.

4. Natural stone with integrated channels are placed in the clamp until the stone reaches the pre-assembled safety spring secures it.

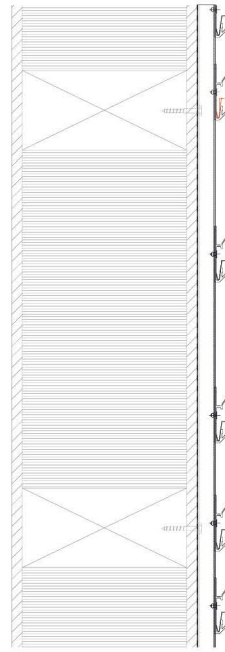

5. Complete suspended LINEA cladding system.

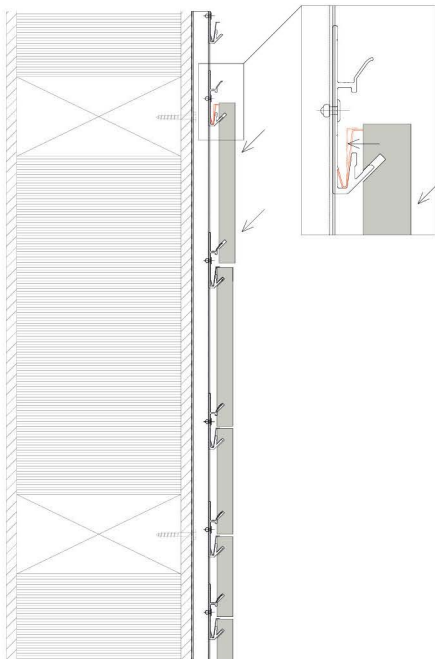

Installation on wooden beams

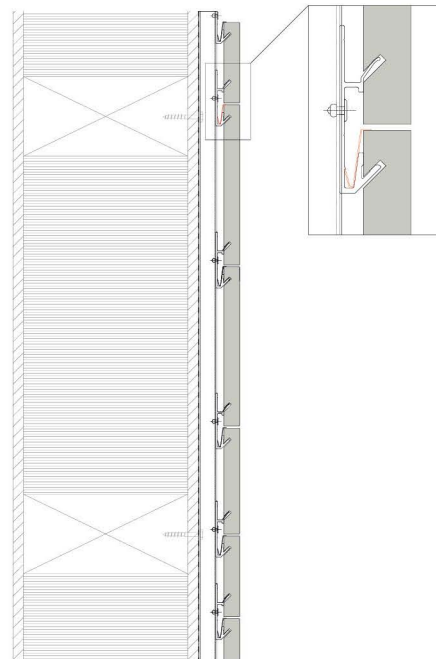

1. Cladding membrane is fixed to the wooden element.

2. Vertical GFT 88 bearing load profile incl. pre-assembled clamps are screwed into the wood. A fix- and variable floating point must be designed for the vertical profiles.

3. Natural stone with integrated channels are placed in the clamp until the stone reaches the pre-assembled safety spring secures it.

4. Complete suspended LINEA cladding system.

The new natural stone façade

Invisible Under-Construction

Specification

Page 1/4

All building components of the façade planner regarding the under construction in this specification are marked and pictured in black.

These details are offered as a planning basis..... as well as the plan.....The detailed plan with system cutting allotment and execution details are attached for further planning. The dimensions and profile are to be taken out of the description for the calculation basis. Connections are to be produced covered and riveted. Dilatation must be taken into account for the prevention of noise development. The connector/ piles / dilatation detail must be submitted with the offer.

1.1 Planning

The planning documents provided to you serve as a basis for measurement, system model and calculation. The complete façade is to include all reference lines (in x, y and z-axis) including the evaluation of the measurements. The alignment of the façade is done by laser, the tolerances of the unevenness is up to 20mm and needs to be adjusted through the under construction. Construction management must be informed of deviations larger than 20mm. The allocation, element and position plan as well as a detailed plan for all necessary connecting points must be worked out and provided to the architect in two copies for approval.

Pos. 1.1	Total	1 gl
----------	-------	------	-------

1.2 Statical calculation

The planning documents provided to you were tested statically. Construction, dimensions and profile cross sections must once again be statically tested. Furthermore the various substrates must be explicitly integrated and tested. Extracting tests for the anchors must be conducted and documented on-site on substrates with unknown stability. Proof of testing must be divided according to the structural plan and reported. All statically proofed testing must be provided to the architect twofold.

Pos. 1.2	Total	1 gl
----------	-------	------	-------

1.3 Samples

A 3-piece façade sample is to be constructed according to plan. The exact construction sites will be defined by the architect and construction management. The mock up contains a joint formation in transition, façade conclusion as well as an exterior corner and an interior sample. An insulated construction including cut out for blind holders are to be installed. All construction materials are to be installed with original profiles or replica and cover. The mock up is to be deconstructed and presented for reference to the builder at the beginning of construction.

The sample is to be used for the indemnification of the details and must be integrated with the appropriate lead time in the execution timeline.

All costs for connections, transitions, cutting, anchor materials, as well as cut outs, waste, tool costs, assembly and disassembly etc. are to be calculated in the unit price.

Pos. 1.3	Total	1 gl
----------	-------	------	-------

2.0 Under construction

See Detail

The under construction consists of a primary horizontal level as well as a secondary vertical under construction. This primary construction

contains CNS- and GFT Thermico STAR consoles with horizontal load bearing profiles or alternatively with GFT Economica consoles including isolator. Tolerances of up to 20mm can be absorbed by the consoles, the evening out of unevenness must be included in the calculation.

The horizontal support spacing of the consoles are provisionally calculated with....mm and must be statically tested.

A GFT-CNS console thread must be anchored in the front of the ceiling of each story in order to carry the main weight burden. Horizontal

GFT Thermico STAR consoles fill the area in between. The distance between the vertical profiles can be tuned in accordance with the statically maximum allowance of the support spacing and can additionally be adjusted to the established U-value.

The underconstruction fulfills a U-value ofWm/K. The insulation area ismm, the isolation between the horizontal load bearing

profiles is to be clamped and additionally fastened mechanically according to the installation guidelines of the manufacturer.

The subsequent vertical construction consists of strand profiles GFT 88 – head profile which are double riveted on the cross point of the horizontally shifted under construction. These make up the clamp lead of the stone fixation.

The dilatation gap and sketch must be calculated with a 3mm shock joint formation and profile. By installation of the vertical profiles

there is a correct fix- and variable point according to statical calculation that must be accounted for. In the locating channel of the GFT-88 -, profiles of various GFT gaps and finishing clamps must be riveted and fixed according to the height of the stone panels.

The prerequisite for the façade is a complete grid arrangement, or prearrangement of the profiles and clamps in the factory as another execution possibility.

All parties relevant to the installment of the façade must be in accordance.

A statical test certificate of the construction must be produced and enclosed.

All transitions, endings, cuts, anchor materials as well as cut outs, waste, tool costs, etc. must be calculated into the total costing.

All finishes are to be done according to the specifications of the architect:

3.0 Façade covering with natural stone

Façade- natural stone

See Detail.....

The natural stone façade system LINEA comes in various natural stones with different finishes. Natural stones and finishes are available in various combinations. In addition the stone panels are available in different sizes and thicknesses. The coordination of the installation foundation, under construction, panel dimensions and static requires a detailed, exact planning of the façade. Panel heights are available between 120 up to 200mm, standard heights are 121 / 152 / 183mm, see detail. Panel lengths are between 450 and 900mm in random lengths or in exact lengths. Panel thickness is approximately 30mm. Panel thickness' can also be produced in 40mm in order to achieve design variations. Static proof must be provided. Exterior as well as interior corners can be cut on a miter and specifically ordered. The LINEA system calls for angled slots in the back of the natural stone panels, these allow for quick and easy installation of stone panels without the use of concrete. Safety clamps inhibit the movement of the stone panels from side to side. Damaged stones may be individually replaced depending on the gap size. All visible clamps and anchors in open gap areas will be colored according to the wishes of the architect. All installation works are to be coordinated with transitions and conclusions. All transitions, endings, cuts, anchor materials as well as cut outs, waste, tool costs, etc. must be calculated into the total costing.
